No. 469

SCIENCE IN AMERICA.

PROTECTION.

To the Editors of the Nation.

SIR: Your favor of December 12, 1868, outlined some points regards to the section of the re-intro.

We are now in the position to work the principles of protection, but with the exception of a few of the regular trade unions, the laboring man is, as a rule, unorganized. There is a possibility of great advantage in the present system, but it is not likely to be realized in the near future.

The preceding sections are somewhat in advance of the present state of society, but with a little more study and reflection, they may be made to yield valuable information.

The principle of comparison is very important, as it is the foundation of all the other principles.

The whole subject is too complex to be discussed in a few pages, but the following points are worth noticing:

1. A comparison of the different systems of protection.
2. The advantages and disadvantages of each system.
3. The principles underlying each system.
4. The practical application of each system.

We are, etc.,
