The Nation.

December 14, 1895

A NEW HORIZON in the study of the American Indian is likely to result from the discovery of a new method of classifying the various tribes. This method, which has been developed by a group of anthropologists at the University of California, is based on the study of the physical characteristics of the different tribes. The method involves the use of a series of measurements, such as head and body length, and the analysis of these measurements using statistical techniques. The result is a classification of the tribes based on their genetic relationships, which provides a new perspective on the history and evolution of the American Indian populations.

The study of the American Indian is of great importance for understanding the history and culture of the United States. The American Indians are one of the oldest and most diverse cultures in the world, and their history is rich with cultural traditions and contributions. However, until recently, the study of the American Indian has been limited by the lack of accurate and comprehensive data. The new method developed by the University of California team provides a much-needed tool for researchers and provides a new perspective on the history and evolution of the American Indian populations.

The new method is based on the analysis of physical characteristics, such as head and body length, and the use of statistical techniques to classify the different tribes. This approach provides a more accurate and comprehensive understanding of the genetic relationships among the American Indian populations. The method also allows for the identification of cultural groups that were previously overlooked, providing a new perspective on the history and evolution of the American Indian populations.
