The Nation

[Vol. 78, No. 2015]

The children were Orangemen—a stamp of them was also on the covers of the paper and on the covers of the magazine. They were a patriotic people, and they had a natural sympathy with the cause of the Union. There was a strong feeling of kinship, and this was a natural result of the political and social conditions of the time. The Union was a great and powerful nation, and it was the duty of every citizen to do all in his power to uphold and strengthen it. The children were the future of the nation, and they were taught to be proud of their country and to love its institutions. They were taught to be loyal to the Union and to the Unionist party, and they were encouraged to work for the advancement of the Union in all its branches.

Four books on electricity are before us. The first of these, which is intended for the general reader, is a treatise on the subject of electricity, dealing with the phenomena of electricity and the properties of electric currents, and is intended for the use of students of electricity. The second book is a treatise on the properties of magnetic lines, and is intended for the use of students of magnetism. The third book is a treatise on the properties of magnetic fields, and is intended for the use of students of electromagnetism. The fourth book is a treatise on the properties of electric waves, and is intended for the use of students of electrodynamics.

Among the books reviewed during this month, we may mention the "Electrical Science," by J. E. B. Basset. This is an excellent book, and we congratulate the editor on his choice of a subject which is so well suited to the needs of the time. We hope that the author will continue to write such books, and we hope that many others will follow his example.

The "Electrical Engineering Review" is a good technical book concerning instruments, apparatus, and methods in England. As electrical science advances, the "Electrical Engineering Review" will become more and more valuable, and we shall be glad to see it continued.
